A new lighting concept is introduced to the Beirut urban scene, revealing the city center architecture by night.

On June 18, 2011, Lighting Beirut Architecture is launched as the first project to outline the architecture of a large urban area using the concept of permanent image projection. Tailor-made projectors retroe, with light, the existing façade features of selected heritage and contemporary buildings in the historic core of Beirut.

Beyond this first initiative, the project aims to turn the city center into a lively platform for creative expression.
